

Identification of studies via databases and registers

*We considered the articles from the 10 first pages of GScholar and Pubmed for the searches of "contrast sensitivity schizophrenia", "contrast threshold schizophrenia" and "contrast detection schizophrenia". This led to 600 articles. Beyond this, we identified 5 additional articles related to the topic.

**No automation tools were used.

*We excluded reviews and studies measuring contrast surround suppression, contrast in the presence of flankers, or missing a control group. We also excluded studies that reused data from previous experiments.
